SKILLS

Languages	C++, JavaScript, TypeScript
Web	React.js, Next.js, Node.js, Nest.js, GraphQL, Redux, Tailwind, Antd, PayloadCMS, Chart.js, TypeORM, PrismaORM
Game Dev	Unreal Engine 5, UMG, Blueprints, CommonUI, Enhanced Input
Tools & Others	Git, AWS, Chrome Extensions (Chrome API), PostgreSQL, MongoDB
Spoken	English (B2), Ukrainian (Native), Polish (A2)

SUMMARY

Motivated Software Engineer with 2.5 years of experience in JavaScript, TypeScript, React, and Node.js. As a self-taught developer, I am a dedicated and hardworking individual with a strong passion for personal and professional growth in the field of information technologies. Currently expanding into game development using C++ and Unreal Engine 5, working on a survival game while continuously strengthening my C++ skills. I'm always eager to expand my expertise, adapt to new technologies, and deliver practical solutions that add value. With strong problem-solving skills and a collaborative mindset, I confidently handle different parts of the development process and contribute effectively to team projects.

GAME DEVELOPMENT PROJECTS

Wilderness Alone — Top-Down Survival Game (UE5, C++)

<https://github.com/pasivad/WildernessAlone>

Personal project built in Unreal Engine 5.7 with all core systems implemented in C++. UI logic handled in Blueprints with the CommonUI plugin for proper UI stack management.

Scope of work:

- Implemented top-down character movement, camera with spring arm, and sprint mechanics
- Built health and stamina systems with damage, regeneration, and HUD progress bars in UMG
- Created a 27-slot grid inventory system with item stacking and pickup interaction
- Set up Enhanced Input with Input Mapping Context for flexible input remapping
- Integrated CommonUI for pause menu and UI stack handling, following Epic's recommended UI architecture
- Implemented basic enemy AI with detection, chase, and attack behaviors

Tools and technologies:

Unreal Engine 5.7, C++, Blueprints, CommonUI, Enhanced Input Plugin, UMG, Git LFS

Console Snake Game — Pure C++

<https://github.com/pasivad/SnakeGame>

First C++ game project — built to remember core language features, the standard library, and basic game loop architecture. Implemented input handling, grid-based collision detection, score tracking, and game state management from scratch.

EDUCATION

Front-end React JS Web Development Course

Apiko Academy

2021 - 2022

Bachelor's Degree in Software Engineering

West Ukrainian National University

2020 - 2024

Master's Degree in Software Engineering

West Ukrainian National University

2024 - 2026

PROFESSIONAL EXPERIENCE

Full-Stack Developer — Apiko

Dec 2023 - March 2026

Digital transformation consultancy & software development company

Lanai — AI-native enterprise SaaS platform (Apr 2024 – Aug 2025)

AI usage monitoring and security platform for enterprises, founded by tech veterans from Google and VMware.

<https://www.withlanai.com>

- Built a Chrome extension (Chrome API) to track and analyze generative AI activity across multiple web platforms — gaining hands-on experience with event-driven UI, cross-context messaging, and DOM observation
- Developed an admin panel front-end with Next.js and Chart.js for policy configuration, AI usage monitoring, and data visualization
- Implemented backend services in Nest.js for securely storing, processing, and analyzing prompt data
- Integrated identity providers (Auth0, Okta SDK, Microsoft Graph, PingOne) and built mechanisms to detect AI requests across emerging tools

Tools and technologies:

TypeScript, Next.js, Nest.js, Chart.js, CockroachDB, PostgreSQL, TypeORM, Chrome API

Other projects at Apiko:

- **Huddex** (Dec 2023 – Mar 2024) — Peer-to-peer package shipping mobile app. Built admin panel and GraphQL backend services; integrated SendGrid, SMS, Slack, and IDWise identity verification.
- **Hotaly** (Sep 2025 – Feb 2026) — Multi-brand venue listing platform. Built front-end sites and an admin dashboard from a single codebase using Next.js, PayloadCMS, Radix UI, and MongoDB.
- **Andy's Bet Club: Football Predictor** (Aug 2025 – Sep 2025 and March 2026 - April 2026) — Football prediction game with leaderboards. Implemented ranking logic, scoring, and football-data API integration with React, Nest.js, PostgreSQL, and Redis.
- **AI-Powered User Story Generator (PoC)** (March 2026) — Node.js pipeline that converts screen recordings into structured implementation stories using multimodal AI. Built CLI tool with ffmpeg-based audio/frame extraction and integrated OpenAI to correlate narration with UI actions and produce schema-enforced JSON output via Function Calling.
